Customer oriented solutions

Through polymer engineering and application expertise, Trelleborg strives to deliver optimum performance for all our customers needs. Tailored for specialist applications and environments, our tires provide innovative solutions for a growing range of industries.

Alongside our premium tire and wheel offering for typical material handling applications, Trelleborg also delivers high performance tires for specialist vehicles operating in demanding environments.

Our specialist premium compounds are designed to deliver maximum productivity and sustainability, and adhere to compliant safety regulations to keep operators safe.

Pit Stop Line for safety and tire life

The Pit Stop Line, Trelleborg innovation for our premium range, lets operators and fleet managers know with 100% accuracy when tires need replacing.

**WASTE ON AVERAGE 25%
OF TIRE LIFE DUE TO EARLY REPLACEMENT**

**UNNECESSARY DOWNTIME
AND MONEY WASTE**

**24% OF TIRES
REPLACED TOO LATE**

**VERY HIGH SAFETY RISK
FOR TIRE FAILURE**

The Pit Stop Line is an orange strip which appears approximately 100 hours before the tires need to be replaced. It ensures the tire is only changed when worn out, avoiding to replace it too early and risk spending too much, or replace it too late and risk machine and operator safety.

The right tire in all working conditions

Trelleborg's unique application intensity rating system helps customers to easily identify the solution that best fits their needs ensuring maximum efficiency and performance.

LOAD CAPACITY

Trelleborg tires fall fully under recommended load carrying capacities as indicated by the main worldwide technical organizations.

WORKING TIME

Working solid tires non-stop can potentially cause a buildup of heat and reduce lifespan.

AVERAGE SPEED

High speeds may cause internal stress and deformation leading to overheating, compromising tire performance.

CYCLE LENGTH

Long distances prevent dissipation of heat generated during operations which can create dangerous separation within the tire.

CORNERING

Repetitive vehicle cornering produces excessive torque on the tire, increasing the likelihood of deformation.

Inflation pressure

- Most tire damages are due to, or aggravated by, incorrect inflation pressures.
 - Under-inflation causes over-heating and can greatly shorten the life of a tire. It reduces stability and can cause irregular wear, internal damage and, ultimately, even tire break-up.
 - Over-inflation causes the tire to be more susceptible to impact damage and in extreme cases may result in rim deformation or even a tire burst.
 - Inflation pressures must be checked regularly at least once a fortnight - These checks should be made only when tires are cold because pressure rises as they warm up in running. Never bleed warm tires.
- Cold inflation pressures must always comply with the vehicle or tire manufacturer's recommendations for the vehicle, type of tire and the intended service. Pressure increase during running, which may reach or even exceed 20%, is normal and is allowed for in the design of the tire. Therefore the inflation pressure of warm tires must never be adjusted back to the recommended (cold) values.
 - Note that the valve cap, which must be of the sealing type, acts as a supplementary air seal and should be fitted at all times.
